

Chat filter: one two-letter rule censors thousands of ordinary words

Ragnarok: Rebirth Global · measured against the live service · 11 September 2026

The filter blocks the two-letter sequence **cu** and matches it as a raw substring. Every word containing those letters is refused, in every language.

VERIFIED IN THE LIVE GAME

cu	blocked	cut	blocked	cute	blocked	cup	blocked	cure	blocked
discuss	blocked	document	blocked	vacuum	blocked	circus	blocked		
curious	blocked	thanks	blocked	understand	blocked	curse	blocked		

5,928 test messages were sent to the live service. 693 ordinary dictionary words were confirmed refused; 4,462 were confirmed to pass. Each headline word above was re-tested three times and blocked every time.

WHY IT HAPPENS

cu is vulgar in **Portuguese**. It appears to have been added for that market, but it is matched as a substring against **all eight** languages the title ships in.

The result is that a single two-letter entry censors ordinary vocabulary everywhere, including Portuguese itself — where it does the most damage.

WORDS CONTAINING “CU”

VOCABULARY	AFFECTED
English dictionary	5,018
Your Portuguese strings	530
Your English strings	297
Your Indonesian strings	251
Your Thai strings	114

IT IS ALSO MISSING WHAT IT SHOULD CATCH

Tested against the same live service: kike, spic, fag, rape, whore, bitch, dick and slut all **pass unmodified**. Spaced-out evasion is caught for some terms (s h i t is blocked) but not others (f u c k passes). Correcting the matching improves accuracy in **both** directions — this is not a request to moderate less.

RECOMMENDED FIX

1 Immediate. Remove cu, or restrict it to Portuguese and to whole-word matching. This single change resolves the large majority of the false positives in every market.

2 Structural. Require a minimum length before a term may match inside a longer word, and scope each term to the locale it was added for. A two-letter entry should never match as a substring.

3 Supplied. A verified list of **693 ordinary words** currently refused by your service, each confirmed by a live test message. Purely additive — it can only remove false positives.

Also included: the raw log of all 5,928 probes, so any single claim here can be traced to the message that established it.

Method. Messages were sent through the ordinary game client at human pacing and the result recorded from the client's own response. No account, protocol or server was accessed in any other way. Findings reported here were re-tested three times; six words that failed re-testing were discarded rather than reported. · Fixes are server-side: no client update or store review is required.
