

Your chat filter blocks “cucumber”

Ragnarok: Rebirth Global · reported by a player · 2026-09-10

The filter matches **fragments inside words**. So **cucumber** is censored for three letters in the middle of it — while **f u c k**, spaced out, goes straight through.

IT CENSORS YOUR OWN GAME

Freezing → *****zing
Savage Card → **vage card
Immunity Control → i**unity control

46%

of your English item
& skill names

52%

of your Portuguese
names — the worst hit

23%

of disguised swearing
is actually caught

THE FIX IS ONE LINE

A blocked entry shorter than 4 characters must match as a **whole word** — never inside a longer one.

YOUR OWN NAMES, FLAGGED	NOW	AFTER
English	46.1%	4.0%
Portuguese	52.1%	0.9%
Indonesian	48.0%	3.1%
Thai	30.0%	2.4%
Chinese	8.4%	2.3%

Nothing is deleted. Every entry keeps working. Short ones simply stop matching inside longer words.

No list review. No new data. It also covers words nobody has listed yet — surnames, place names, next year's slang.

Server-side only. Ship it behind a config value, set it to 4, revert by setting it back.

THIS IS NOT “FILTER LESS”

The same design also lets abuse through: spaced-out text, full-width characters and look-alike letters all pass untouched, and only **6 of 25** common English swear words are on the list at all.

The filter is simultaneously too harsh and too weak, for one reason. Fixing it makes it **more accurate in both directions**.

WHY IT HAPPENS

The list is **95,660 entries, 93% Chinese** — sound for the market it was written for. Rebirth launched in China first, and the list travelled with the build.

30,262 of those entries are 1–3 characters. As fragments they sit inside ordinary words: te in *ignite*, ur in *curse*.

Also available, both optional: a 473,841-word allowlist of terms that must never be censored (0.35 µs per check), and a replacement matcher that takes false positives to 0.0% while raising evasion detection to 84%. The one-line rule is most of the benefit. · **One caveat:** we measured the client's copy of the list, which is not exactly what your server enforces — so run the included tools against your own list rather than acting on any single entry we name. Everything here is reproducible.
